✓ Sense of responsibility

PREDICTIVE MAINTENANCE ENGINEER

✓ Field working
✓ Continuous improvement
✓ Investment
✓ Expansion
✓ Innovation
✓ Skills
✓ Sense of responsability
✓ Professionalism
✓ Travelling

Florent, Reliability Engineer

"I start my day conversing with my colleagues (it's a great way to know what's going on around me and learn new things). I review the planning, the scheduled visits, and the more urgent consignment records to plan my day. I meet the drawers who provide me with the technical plans (PID). Then, I go out into the field to learn how to fill my consignment records and also take some pictures.

If I have technical questions, I ask my colleagues and collect all required information. Back at the office, I start completing the forms and I request information from the HSE manager about potential specific measures. I add to my forms the needed material as well as my risk analysis. Once completed, I send the form to maintenance for validation. After validation, I will start encoding into the customer's server."

Jonas, Product Engineer

"My main tasks consist of answering technical questions from customers or colleagues (email/phone calls). I send price quotations to our customers (material, installation, and/or training). I will negotiate with our suppliers about technical and commercial aspects and, in turn, I negotiate details with the customers and then finalize orders with our suppliers.

When the orders arrive at our offices, I check and take delivery of it. I then package the orders and send to our customers. Finally, to close the process, I encode the activity within our invoicing program."
